CLEANING RECOMMENDATIONS.

The Frequency of cleaning can only be accurately determined after a period of occupancy, and will depend upon many factors, such as the level of occupancy, the nature of the activities within the area and the efficiency of any air conditioning.

An annual cleaning cycle is likely to be adequate for ceilings in most modern office environments, whereas an industrial kitchen or factory area may well need to be cleaned two or three times within the same period if its appearance and condition is to be maintained.

The standard polyester powder coated paint gives an extremely durable surface that is easily cleaned using a mild liquid cleaner diluted in warm water and applied with a clean soft cloth or sponge.

During cleaning infill panels should be removed and close attention should be paid to any other services in contact with or near to the area being cleaned.

On no account should abrasive cleaners be used.

If any further information is required please contact the Technical Department on the above number.
